Power BI Developer Accelerator

Daily Quiz & Answer Key

Day 1

Questions and expected answers

1. What is a fact table?

Expected: A table storing business events/measures at a defined grain.

2. What is a dimension?

Expected: A descriptive entity used to filter/group facts.

3. Best visual for a trend?

Expected: Usually a line chart.

4. Measure vs attribute?

Expected: Measure is a calculation; attribute is descriptive data.

5. Why use slicers?

Expected: To let users interactively filter report context.

Day 2

Questions and expected answers

1. Merge vs Append?

Expected: Merge combines columns using a join; Append stacks rows.

2. Why fix data types?

Expected: Incorrect types break calculations, joins and time analysis.

3. What is a query step?

Expected: A repeatable transformation recorded in Power Query.

4. One data-quality risk?

Expected: Duplicates, nulls, invalid dates, inconsistent keys, etc.

5. When use DirectQuery?

Expected: When source-scale/latency/security requirements favor querying the source.

Day 3

Questions and expected answers

1. Typical fact-to-dimension cardinality?

Expected: One dimension row to many fact rows.

2. Preferred model?

Expected: Star schema.

3. Why date dimension?

Expected: Consistent time filtering and time intelligence.

4. Risk of ambiguous relationships?

Expected: Unexpected/incorrect filter propagation and totals.

5. Why avoid unnecessary many-to-many?

Expected: It increases ambiguity and calculation complexity.

Day 4

Questions and expected answers

1. Visual for ranking?

Expected: Bar/column chart.

2. What is visual hierarchy?

Expected: Ordering content so users see key information first.

3. Why tooltips?

Expected: Provide context/detail without cluttering the main page.

4. One UX anti-pattern?

Expected: Too many visuals, inconsistent units, unclear labels, etc.

5. Why conditional formatting?

Expected: Quickly communicate status or exceptions.

Day 5

Questions and expected answers

1. Why measures?

Expected: Reusable calculations evaluated in filter context.

2. Why DIVIDE?

Expected: Safer division when denominator can be zero/blank.

3. What does CALCULATE do?

Expected: Evaluates an expression under modified filter context.

4. What is YoY?

Expected: Comparison with the corresponding prior-year period.

5. Why validate DAX?

Expected: To ensure logic and filter behavior match business expectations.

Day 6

Questions and expected answers

1. First step with vague requirement?

Expected: Clarify business questions/KPI definitions and assumptions.

2. Prototype purpose?

Expected: Rapidly validate requirements and UX before production hardening.

3. What is KPI dictionary?

Expected: A documented definition/source/aggregation/owner for each KPI.

4. Why wireframe?

Expected: Align page structure before implementation.

5. Customer demo goal?

Expected: Confirm understanding and gather feedback.

Day 7

Questions and expected answers

1. Drill-down vs drill-through?

Expected: Drill-down changes hierarchy level; drill-through navigates to detail filtered by context.

2. Why bookmarks?

Expected: Save/report specific visual states and navigation experiences.

3. Why test filter states?

Expected: Interactions can expose relationship and calculation defects.

4. What is dynamic title?

Expected: A title that reflects current filter/selection context.

5. Why navigation buttons?

Expected: Create application-like user journeys.

Day 8

Questions and expected answers

1. Can AI DAX be trusted automatically?

Expected: No; it must be understood and validated.

2. What must not be shared with unapproved AI?

Expected: Confidential/customer-sensitive data and credentials.

3. Useful AI task?

Expected: Draft DAX, M, test cases, requirement decomposition, UX review.

4. Why give schema to AI?

Expected: To reduce invented table/column names.

5. Best AI workflow?

Expected: Human intent → AI draft → human review → test → deploy.

Day 9

Questions and expected answers

1. Legacy metric mapping?

Expected: Usually a Power BI measure, after understanding business logic.

2. Legacy prompt equivalent?

Expected: Often a slicer/filter.

3. Why screenshot matching is insufficient?

Expected: It does not prove business logic or numerical equivalence.

4. What is reconciliation?

Expected: Comparing outputs to an authoritative expected result.

5. What should a gap log contain?

Expected: Gap, impact/risk, owner, decision/status and workaround if any.

Day 10

Questions and expected answers

1. Critical capstone criterion?

Expected: Correct, validated business results.

2. What makes production different from prototype?

Expected: Security, performance, governance, refresh, maintainability and deployment.

3. Why document assumptions?

Expected: To make unresolved business decisions visible.

4. What should the demo show?

Expected: Requirements, design, report, insights, validation and trade-offs.

5. Certification threshold?

Expected: 70% overall with no critical failure.
